Business Case Studies

Target SQL

Samaresh Kumar Pradhan

Introduction

Target is a globally renowned brand and a prominent retailer in the United States. Target makes itself a preferred shopping destination by offering outstanding value, inspiration, innovation and an exceptional guest experience that no other retailer can deliver.

- This particular business case focuses on the operations of Target in Brazil and provides insightful information about 100,000 orders placed between 2016 and 2018.
- By analyzing this extensive dataset, it becomes possible to gain valuable insights into Target's operations in Brazil. The information can shed light on various aspects of the business, such as order processing, pricing strategies, payment and shipping efficiency, customer demographics, product characteristics, and customer satisfaction levels.

Content

1. Exploratory Analysis
    1. Import and analyze dataset structure , Check data types in the "customers" table and Find time range of orders and count customer cities/states
2. In-depth Exploration.
    1. Explore order trends over years and monthly seasonality
    2. Identify preferred order times for Brazilian customers.
3. Evolution of E-commerce Orders in Brazil.
    1. Examine monthly orders by state along with Study customer distribution across states
4. Impact on Economy.
    1. Analyze order prices, freight, and cost increase from 2017 to 2018.
    2. Calculate total and average order prices and freight by state
5. Analysis Based on Sales, Freight, and Delivery Time.
    1. Calculate delivery time and estimate accuracy.
    2. Find top 5 states with highest/lowest freight and delivery times
    3. Identify states with faster delivery than estimated
6. Analysis Based on Payments.
    1. Track monthly orders by payment type
    2. Count orders based on payment installments
7. Actionable Insights and recommendation

1. Import the dataset and do usual exploratory analysis steps like checking the structure & characteristics of the dataset

Question : Data type of all columns in the "customers" table.

Query : SELECT column_name, data_type FROM `scaler-dsml-sql demo.scaler_target_dataset.INFORMATION_SCHEMA.COLUMNS` WHERE table_name = 'customers';

Row	column_name	data_type
1	customer_id	STRING
2	customer_unique_id	STRING
3	customer_zip_code_prefix	INT64
4	customer_city	STRING
5	customer_state	STRING

Question : Get the time range between which the orders were placed

Query : SELECT MIN(order_purchase_timestamp) AS min_order_date, MAX(order_purchase_timestamp) AS max_order_date FROM `scaler_target_dataset.orders`;

Query results

JOB INFORMATION RESULTS JSON EXECUTION DETAILS

Row	min_order_date	max_order_date
1	2016-09-04 21:15:19 UTC	2018-10-17 17:30:18 UTC

1. Import the dataset and do usual exploratory analysis steps like checking the structure & characteristics of the dataset

Question : Count the Cities & States of customers who ordered during the given period.

Query : SELECT c.customer_city, c.customer_state, COUNT(*) AS order_count
FROM scaler_target_dataset.customers AS c
JOIN scaler_target_dataset.orders AS o ON c.customer_id = o.customer_id
JOIN TimeRange AS tr ON o.order_purchase_timestamp BETWEEN tr.min_purchase_timestamp AND tr.max_purchase_timestamp
GROUP BY c.customer_city, c.customer_state
ORDER BY c.customer_state, c.customer_city;

Query results

5. Analysis based on sales, freight and delivery time.

Question: Find the no. of days taken to deliver each order from the order's purchase date as delivery time. Also, calculate the difference (in days) between the estimated & actual delivery date of an order.
Do this in a single query.

You can calculate the delivery time and the difference between the estimated & actual delivery date using the given formula:

i. time_to_deliver = order_delivered_customer_date - order_purchase_timestamp
ii. diff_estimated_delivery = order_estimated_delivery_date - order_delivered_customer_date

```
SELECT
    o.order_id,
    DATE_DIFF(o.order_delivered_customer_date,
o.order_purchase_timestamp, DAY) AS time_to_deliver,
    DATE_DIFF(o.order_estimated_delivery_date,
o.order_delivered_customer_date, DAY) AS
diff_estimated_delivery
FROM
    `scaler_target_dataset.orders` AS o
WHERE
    o.order_delivered_customer_date IS NOT NULL
    AND o.order_estimated_delivery_date IS NOT NULL;
```

6. Analysis based on the payments

Question : Find the month on month no. of orders placed using different payment types.

```
WITH MonthlyOrders AS (
    SELECT
        EXTRACT(YEAR FROM
o.order_purchase_timestamp) AS order_year,
        EXTRACT(MONTH FROM
o.order_purchase_timestamp) AS order_month,
        p.payment_type,
        COUNT(o.order_id) AS num_orders
    FROM
        `scaler_target_dataset.orders` AS o
    JOIN
        `scaler_target_dataset.payments` AS p
    ON
        o.order_id = p.order_id
    GROUP BY
        order_year, order_month, payment_type
)
```

```
SELECT
    order_year,
    order_month,
    payment_type,
    num_orders
FROM
    MonthlyOrders
ORDER BY
    order_year, order_month, payment_type;
```

6. Analysis based on the payments

Question : Find the no. of orders placed on the basis of the payment installments that have been paid.

```
WITH OrderInstallments AS (
    SELECT
        p.order_id,
        p.payment_installments,
        COUNT(*) AS num_orders
    FROM
        `scaler_target_dataset.payments` AS p
    GROUP BY
        p.order_id, p.payment_installments
)

SELECT
    payment_installments,
    COUNT(DISTINCT order_id) AS num_orders
FROM
    OrderInstallments
GROUP BY
    payment_installments
ORDER BY
    payment_installments;
```

7. Actionable Insights and recommendation

1. The analysis of order delivery data highlights several important insights. First, there is a notable inconsistency in delivery times across different orders. Some customers receive their orders significantly later than expected, which can lead to dissatisfaction. Second, some orders are delivered earlier than their estimated delivery dates. While this may seem positive, maintaining a consistent delivery schedule is crucial to meet customer expectations.
2. For states with high average freight values (e.g., RR, PB, RO), consider optimizing logistics & shipping operations to reduce freight costs. This may include negotiating better rates with carriers, optimizing delivery routes, or exploring regional warehouses to reduce shipping distances.
3. Tailor pricing strategies for states with varying freight costs. For states with lower average freight values (e.g., MG, PR, SP), explore opportunities to offer competitive prices to attract more customers. Conversely, for states with higher freight costs, focus on value-added services or product differentiation to justify higher prices.
4. Invest in supply chain optimization to reduce freight costs across all states. This can involve streamlining processes, adopting more efficient packaging solutions, and leveraging technology for better route planning and load optimization.
5. Consider expanding your market presence in states with lower average freight values if there's untapped potential. Conduct market research to understand customer preferences and behaviors in these regions to tailor your marketing efforts effectively.
6. Need to ensure the data quality, more focus on customer communication, improve the operational efficiency by using predictive analysis and collect customer feedback at regular interval could ease the business
7. Benchmark your freight costs & pricing strategies against competitors operating in the same regions to ensure competitiveness & identify opportunities for improvement.
8. Consider aligning marketing and promotional campaigns with the months that have lower average order counts (e.g., September and October). This can help stimulate customer interest and boost sales during slower periods.
9. For regions with lower order counts, consider market expansion strategies to increase your customer base. This could involve targeted marketing campaigns, promotions, or partnerships with local businesses to attract more customers.
10. Focus on engaging with customers in regions with lower order counts to understand their preferences and needs. Collect feedback and use it to tailor your products or services to better suit the local market.
11. Ensure that customer support is readily available for customers in all regions. Offer personalized assistance and ensure that customers have a positive shopping experience, regardless of their location.
